“We are like dwarves perched on the shoulders of giants, so that we can see more and farther than they did, yet not because our sight is sharper, or our body greater, but because we are carried aloft and raised to the height of giants”.

~ Bernardo di Chartres
Saving on costs, tolls, fuel and the environment

To every manufacturing company transportation represents an important component in the total cost of product unit. Being able to sensibly reduce costs while keeping the quality of service and the safety high, and respecting the schedule often is a key competitive factor in the market.

Our industry reinvent itself perpetually: new discoveries, inventions and challenging solutions provide new opportunities. Selecting those opportunities and creating customized solutions for specific needs is the name of the game. That’s why we invested in Eckstreme Twin Deck Trailer.

Smart solution

With its two loading decks 1.80m high, this is a smart solution that creates a loading volume that is 60% larger than in a normal trailer.

This means that fewer deliveries are needed for the same amount of cargo, resulting in considerable savings in hauling and fuel costs and tollage. Besides that, the larger loading capacity has a 40% lower CO2 emission.

A win-win business

This way we provide the best cost/value ratio in the transport of goods of a certain quality.

This is a win-win business for everyone involved: for our partner, for his customer, for us and for the environment.
